Studies of potato virus X in ultra-violet light. A. Koslowska (Bull.
Acad. Polon. Sci., 1949, Vol. 7(10), 175-316).—Method Atalina
of potato virus X were investigated by means of the intensity of
fluorescence in u.v. light of tobacco leaves infected with the virus.
The fluorescence appeared at varying intervals of time after inocula-
tion. The complete absence of fluorescence in some cases indicated
that u.v. light fluorescence does not confirm absolutely the presence
of virus X. The nature of the fluorescence is discussed.

Problems concerning the activity of molybdenum on metabolism in plant cells. A. Kozlowska (Jagiellonian Univ., Krakow). Bull. intern. acad. polon. sci., Classe sci. math. nat., Ser. B, I, 1951, 205-33.—When plants were grown (1) in water cultures contg. Na molybdate or (2) in nutrient solns. contg. both molybdate and nitrates or (3) in soil rich in nitrates to which molybdate has been added, then the presence of added molybdate had no toxic effect on the plant. However when these plants were grown in soil deficient in nitrates or in a nutrient soln. in which ammonium ions replaced the nitrate as a source of N, then

molybdate was found to exert a toxic effect. Molybdate, in the presence of sulfate and ammonium ions and in the absence of nitrate, was found to be very toxic. However, if nitrate ions were added then no toxic effects were observed.

Methods

Orig Pub: Roczn. nauk rolniczych, 1956, D77, 82 s., il.

Abstract: Results are reported of seven-year investigations in Poland of X and Y potato viruses. Data are cited on the irregular concentration of X- and Y-viruses in separate organs of the plant. The Y-virus switches to an open form when potatoes are raised in high mountain conditions in especially arid and sunny years. In view of the

unequal spread of the virus nucleoprotein in separate eyes of a tuber, the parts of the tuber which contain several eyes should be used for index planting. In seedlings infected with X-virus, scopoletin is accumulated which can be found by the luminescent method. Young tobacco leaves are more suitable for obtaining antigens. Different methods are developed for serological determinations of X- and Y-virus; spectra-photometric and other optical methods of quantitative calculation of virus nucleo-proteins are recommended. -- M. I. Gol'din

Trichomonas vaginalis strains were isolated from patients suffering from trichomoniasis. During examination, the pathogenic fungus Scopulariopsis brevicaulis was separated from a Trichomonas vaginalis culture. It was observed that an increase in number of Sc. brevicaulis was accompanied by a marked multiplication of Trichomonas vaginalis. Sc. brevicaulis not only grows well in the presence of arsenic, but is used as an indicator for detecting traces of arsenic. This is important from the point of view of employing arsenical preparations as therapeutic means.

AUTHORS: Burkiewicz, K., Jarmolińska, M., and Kozłowska, H.

TITLE: Results of investigations into some magnetic properties of thin layers of permalloy produced by electrolytic methods

PERIODICAL: Archiwum elektrotechniki, v. 11, no. 1, 1962, 177-180

TEXT: In an attempt to obtain quick-acting logic and memory elements research has been carried out at the Instytut elektroniki IPP PAN (Institute of Electronics IPPT PAS) on methods of obtaining thin-layered permalloys by vapor deposition in vacuum and by electrodeposition. The technology of electrolytic methods described is based on first covering a thin glass rod with a layer of silver and then subjecting it to electrolytic action in a bath containing nickel and iron anodes. By varying the concentration of nickel and iron ions in various solutions, layers of permalloy were obtained. Oscilloscopic methods were employed for the static measurements of magnetic properties. No attempt as yet been made to eliminate the magnetostrictive properties. Good mechanical and magnetic proper-

"A New Species of the Genus Cephalobus Bast. 1865 (Cephalobus mucronatus n. sp.) and Observations on its Occurrence."

Warsaw, Bulletin de l'Academie Polonaise des Sciences, Serie des Sciences Biologiques, Vol 11, No 5, 63, pp 247-249.

Abstract: [English article, authors' Russian summary] A description is given for a new species of the genus Cephalobus Bast. 1865, the Cephalobus mucronatus n.sp., which is characterized by the presence of large papillae on the lips and of mucro on the tail of both male and female. These characteristics distinguish it from the C. persegnis Bast 1865, with which it was probably previously confused. The new species hosts on Medicago sativa L. roots, and data are given on its annual cycle of occurrence and its percentage in relation to the remaining nematode species with which it occurs. There are four (4) references, of which one (1) is German and three (3) are in English.

KOZŁOWSKA, JADWIGA

On the preparation of 3,5-dinitro-2-hydroxypyridine.
Jadwiga Kozłowska and Edwin Flügel (Politechnika
Wrocław, Poland). Roczniki Chem. 33, 831-4 (1950).
(German summary).—2-Hydroxy-3-nitropyridine (I), m.
225° (15 g.), is added slowly to a mixt. of 30 ml. 40% oleum
with 30 ml. HNO₃ (d. 1.52), keeping the temp. at 80-90°,
followed by heating 40 min. The product is poured into
225 ml. cold water, left 12 hrs., and 50% 2-hydroxy-3,5-
dinitropyridine (II), m. 175-6°, filtered off and recrystd.
from 20% AcOII. 2-Aminopyridine (12 g.) is dissolved
in 48 ml. H₂SO₄ monohydrate (III) and 6 ml. HNO₃ with
12 ml. III added, keeping the temp. at 35-55°, followed by
heating to 80° during 16 min. The product is poured into
150 ml. H₂O, neutralized with (NH₄)CO₃, and alkalized
with 10 ml. concd. NH₃. The dried, raw product (18 g.
mixt. of 2-amino-5- and -3-nitropyridine) is dissolved in
21.5 g. III, poured into 145 ml. H₂O and 114 g. ice, and diazo-
tized with 13.2 g. NaNO₂ and 46 ml. H₂O. The mixt. is
stirred 40 min. at 0°, boiled with C and filtered while hot.
The ppt. is filtered off, the filtrate condensed to 150 ml.,
and neutralized to pH 4 to obtain further ppt. (hydroxy-
nitropyridines). The dried ppt. is nitrated in the same way
as I to obtain 37% II.

Title : A Study of Helminthofauna in Domestic and Wild Foxes

Orig Pub : Acta parasitol. polon., 1957, 5, No 1-12, 181-192

Abstract : On dissecting 109 foxes (84 from breeding farms of the Warsaw and Poznan districts and 25 wild ones), 12 species of helminths were found, three of which (*Metorchis olbidus*, *Pseudoamphistomum truncatum*, and *Thominx böhmi*) are new to Polish fauna. The helminthofauna of wild foxes is richer than that of the farm-bred.
